

||ElevenLabs

ElevenLabs is a tool for text to speech or speech to text generation using generative AI. For this workshop it is the text to speech functions we might use. There are different ways to find this, one is by scrolling to the bottom and selecting “Text to Speech”.

Then it is possible to log in with a Google account, and it can be used for free. However, the amount of text to speech conversions are limited in the free mode.

In the middle of the page is where you insert your text, and you can add up to 5000 characters.

Before clicking “Generate speech” you should adjust the voice. This is done to the right of the middle text section. It is possible to select the “Voice” from a list of different “readers” with different genders and different reading styles. It is also possible to adjust “Speed”, and a few other settings. Only (I think) mp3-format in 44.1kHz and 128kbps is possible to download in the free version. When everything is set click “Generate speech”.

To download the sound, click the download icon.
